GPS calibration of IFAG equipment with respect to PTB G1 (1016-2017)

Summary

Over October 2017- April 2018, the PTB conducted a trip to calibrate GNSS equipment owned by the Bundesamt für Kartografie und Geodäsie (UTC laboratory IFAG). The trip started and finished at PTB, providing closure with respect to PTB Group1 reference receiver PT02. The operations and report of measurements are described in the report by PTB.

- Final results for the calibrated systems

The INTDLY values given in Table 1 have been computed by PTB based on the results of the 1001-2016 Group 1 trip for PT02. They should not be updated to reflect later changes in the conventional INTDLY values of PT02. For a P3/PPP UTC link A-B involving any Group 1 and any receiver in this trip, the uncertainty resulting from the calibration, \( U_B(A-B) \), is computed as

\[
U_B(A-B) = (U_{CAL0}^2 + \Delta U_{CAL}(A)^2 + \Delta U_{CAL}(B)^2)^{1/2}
\]

where \( U_{CAL0} = 2.5 \) ns at the time of calibration, as given conventionally to Group 2, and where \( \Delta U_{CAL} \) is specified for each system. The value \( \Delta U_{CAL} = 1.0 \) ns in Table 1 reflects the significant misclosure, see the PTB calibration report.

Changes in the set-up of the receivers after the calibration must be accounted for as described in section A.3.6 of the Calibration guidelines v3.2 in ftp://ftp2.bipm.org/pub/tai/publication/gnss-calibration/guidelines/.

Table 1. Final P1/P2 INTDLY values from the 1016-2017 trip. Values of REFDLY (with respect to the indicated REF) and of CABDLY during the calibration are also indicated for reference. “Meas. Date” refers to the first day of the differential calibration, to which the calibration results can be applied. “Impl. Date” is the MJD when the results should be implemented in the receiver.
